

Grid and construction

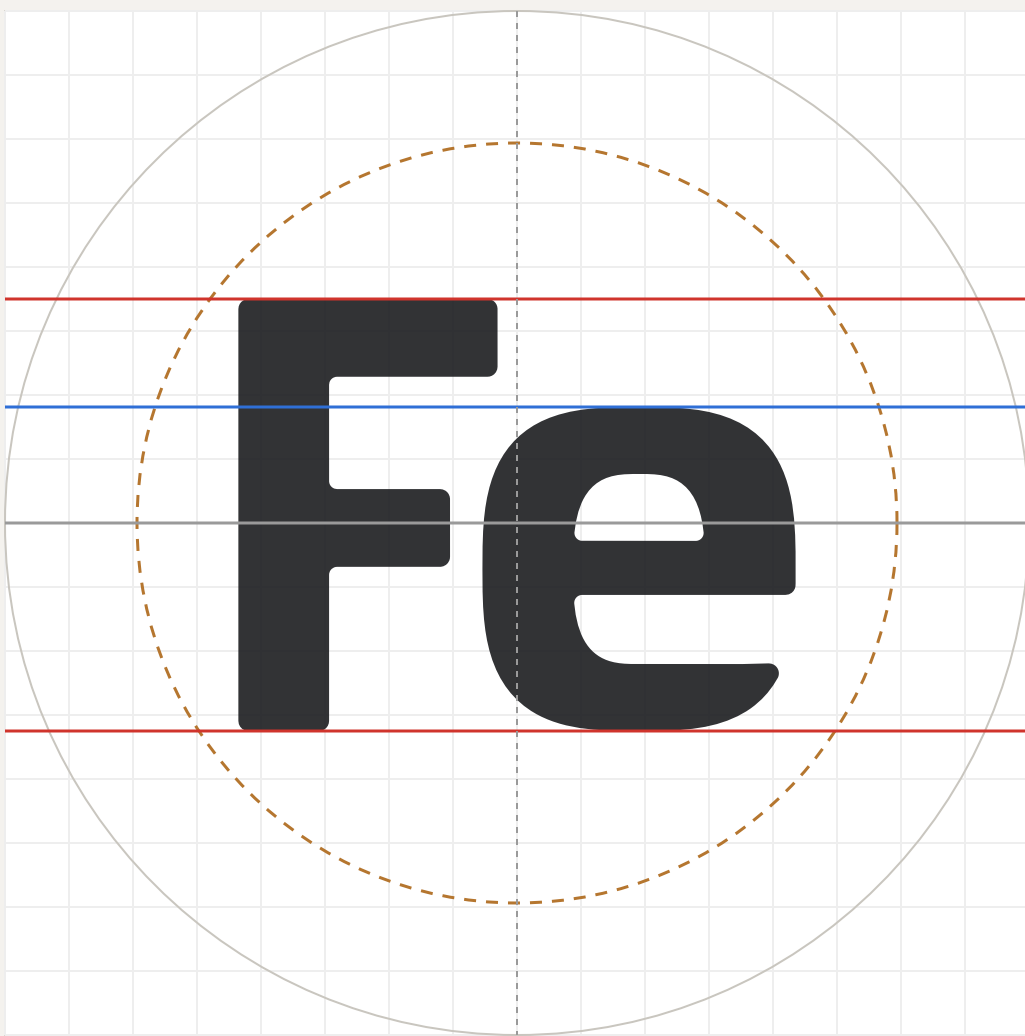

One 1024 canvas, one cap box, one optical centre. Glyphs are centred horizontally on their ink box.

Voxglass — ink radius 330 px

Platterhead — ink radius 362 px

Cladiron — ink radius 353 px

- Cap top 288 / baseline 720 — cap height 432 px
- x-height top 396 — x-height 324 px (0.75 cap)
- True centre 512. Cap box sits 8 px high: optical centre.
- Safe circle $r = 380$ px. All ink stays inside (Watch, Mac, masks).
- 64 px construction grid on the 1024 canvas.

Glyph metrics

Drawn as a set, like one typeface. Values are px on the 1024 canvas.

Canvas	1024 × 1024 px, square, full-bleed. No mask, no rounded corners in the art.
Cap height	432.0 px (42.2% of canvas). V, P and F share it exactly.
x-height	324.0 px. t and e share it; t ascends to cap – 43 px.
Stem (vertical)	90.7 px — every vertical and every V diagonal (measured perpendicular).
Bar (caps)	77.8 px — F arms, P bowl top/bottom.
Bar (lowercase)	67.0 px — t crossbar and foot, e top/bottom.
e crossbar	54.0 px — thinnest element: 3.06 px at 58 px (rule ≥ 2 px).
Curves	Superellipse, n = 3.0, for every bowl, foot and e. No circular arcs.
Corners	Convex corners r = 10 px, concave r = 8 px, V crotch r = 24 px.
Spacing	32 px between letters in Pt and Fe; e tucks under the F top arm.
Glyph gradient	Runs cap top → baseline, identical span on all three, so Liquid Glass catches the same edge.
Letterforms	Custom-drawn outlines from geometric primitives. No typeface was used; nothing to license.

Per-letter ideas, kept inside the rules

V — wide, open stance and a rounded crotch: the spine of an open book, the trough of a wave.

Pt — squircle P bowl like a platter seen edge-on; the gradient ends in a thin brass band, a stylus glint.

Fe — square stance, F arms long and level like a loaded bar; the e is the same squircle as the P bowl.

Palette

Authored in Display P3. sRGB values are exact conversions, clipped to gamut — safe fallbacks.

Voxglass — Warm amber / honey glass

System previews use a sample tint only; users pick their own tint.
Sample tint #4F8DDC (display-p3 0.3686 0.5451 0.8392).

Do / don't

Do

- ✓ Change a colour or metric in palette.py / glyphs.py and rebuild — all three move together.
- ✓ Keep one background fill and one glyph layer per icon. Add an accent layer to all three or none.
- ✓ Tune Clear and Tinted in Icon Composer, never by redrawing the glyph.
- ✓ Use the mono SVGs for docs, web and press. Keep clear space of one stem around them.
- ✓ Test on a real device at 29 pt and on the Watch before any change ships.

Don't

- × Add the app name, atomic mass, taglines or a periodic-table box outline to the icon.
- × Draw hairlines, inlines or outlines — they vanish at 29 pt.
- × Bake in shadows, blur, glass or specular highlights. The system adds them.
- × Give one app a different grid, weight, gradient span or corner radius.
- × Push Platterhead toward amber: it must stay platinum so it never twins with Voxglass.

✓ **Correct**

× **Hairline outline**

× **Words & numbers**

× **Stretched glyph**

× **Busy gradient**

Directions considered (round 1)

Each direction shown as the full family at 1024 (scaled) and 58 px.

A • Element symbol (chosen)

Refines the placeholder concept: custom symbol as the only glyph, metal on near-black. Clearest at 29 pt, strongest family read, zero words.

B • Element tile

The symbol inside a periodic-table cell with the atomic number. Charming at 1024, but the number drops below 2 px at 58 px and the cell outline is a hairline. Rejected.

C • Ingot

A solid metal bar with the symbol cut through it — the glyph becomes the background. Bold, but Tinted mode turns the whole icon into one slab and the letters close up small. Kept as a marketing motif.
